Geometry. Most rifts consist of a series of separate segments that together form the linear zone characteristic of rifts. The individual rift segments have a dominantly half-graben geometry, controlled by a single basin-bounding fault.

[MODEL OF SEA-FLOOR SPREADING - ucmp.berkeley.edu](#)

Thu, 19 Apr 2018 10:27:00 GMT

Purpose: Students will make a paper model illustrating the concept of sea-floor spreading and the development of symmetrical magnetic "stripes" on either side of a mid-ocean spreading center. Suggested Student Grouping: Students work as individuals. Framework Integration: Themes: Patterns of change ...

At transform boundaries, tectonic plates are not moving directly toward or directly away from each other. Instead, two tectonic plates grind past each other in a horizontal direction. This kind of boundary results in a fault — a crack or fracture in the earth's crust that is associated with this ...
